Oral squamous cell carcinomas (OSCCs) are the sixth most common cancer worldwide. This study was designed to investigate the presence of connexin 43 (Cx43) gap junctions in OSCC and its relation to apoptosis. A total of 31 OSCC were classified into stage 1 to stage 4 according to the TNM system. There were 13 (41.9%) stage 1, 6 (19.4%) stage 2, 5 (16.1%) stage 3 and 5 (16.1%) stage 4 OSCC. In all, 14 cases (45.1%) were well differentiated, 11 (35.5%) moderately differentiated and 6 (19.4%) poorly differentiated. The immunocytochemical study showed that Cx43 is expressed in the cytoplasm and in the perineuronal net. In the ultrastructural study, the Cx43 gap junctions were detected. There was a relationship between apoptosis and the presence of Cx43. Apoptosis was detected by TUNEL and was more evident in the OSCC stages. The expressions of Cx43 and apoptosis were related (P 82157476af
